Revision History

Version	Date	Description of changes	Author
1.0.0	2010-02-15	First version (pending EC approval)	Mikkel Hippe Brun, NITA
1.0.1	2010-10-01	EC approved	Klaus Vilstrup Pedersen, DIFI
1.1.0	2012-08-15	Make room for alternative Transport Protocols e.g. AS2	Klaus Vilstrup Pedersen, DIFI
1.2.0	2020-02-20	Updated the references Improved layout Explicitly allowing Content-Type "application/xml" as it is equivalent to "text/xml" (chapter 5.1)	Philip Helger, OpenPEPPOL OO
		Removing the requirement that the encoding attribute value is case sensitive (chapter 5.2)	
		Change "is not" to "MUST NOT" in chapter 5.5 Replaced the references to the BusDox Common Definition document (BDEN-CEDF)

1 Introduction

2 1.1 Objective

1

8

12 13

21

- 3 This document describes the REST (Representational State Transfer) interface for Service Metadata
- 4 Publication within the Business Document Exchange Network (BUSDOX). It describes the
- 5 request/response exchanges between a Service Metadata Publisher and a client wishing to discover
- 6 endpoint information. A client could be an end-user business application or an Access Point. It also
- 7 defines the request processing that must happen at the client.

1.2 Scope

- 9 This specification relates to the Technical Transport Layer i.e. BusDox specifications. The BusDox
- specifications can be used in many interoperability settings. In the Peppol context, it provides
- transport for procurement documents as specified in the Peppol Profiles.

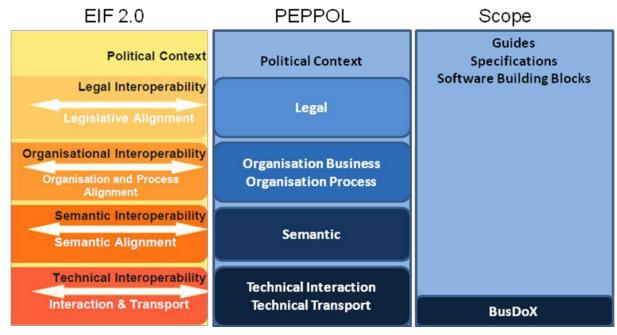

Fig. 1: Peppol Interoperability

14 1.3 Goals and non-goals

- 15 The goal of this document is to define the REST lookup interface that Service Metadata Publishers
- 16 ("SMP") and clients must support. Decisions regarding physical data format and management
- interfaces are left to implementers of such a service.
- 18 Service Metadata Publishers may be subject to additional constraints of agreements and governance
- 19 frameworks within instances of the BUSDOX infrastructure not covered in this specification, which
- 20 only addresses the technical interface of such a service.

1.4 Terminology

- 22 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
- 23 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as
- 24 described in RFC 2119 [RFC2119].

1.4.1 Notational conventions

25

42

60

- 26 Pseudo-schemas are provided for each component, before the description of the component. They
- 27 use BNF-style conventions for attributes and elements: "?" denotes optionality (i.e. zero or one
- occurrences), "*" denotes zero or more occurrences, "+" one or more occurrences, "[" and "]" are
- 29 used to form groups, and "|" represents choice. Attributes are conventionally assigned a value which
- 30 corresponds to their type, as defined in the normative schema. Elements with simple content are
- 31 conventionally assigned a value which corresponds to the type of their content, as defined in the
- 32 normative schema. Pseudo schemas do not include extension points for brevity.

```
33
     <!-- sample pseudo-schema -->
34
     <defined element
35
         required_attribute_of_type_string="xs:string"
         optional_attribute_of_type_int="xs:int"? >
36
37
       <required element />
38
       <optional element />?
39
       <one or more of these elements />+
40
       [ <choice 1 /> | <choice 2 /> ]*
41
     </defined element>
```

1.4.2 Normative references

xs	http://www.w3.org/2001/XMLSchema

2 The Service Discovery Process

- The interfaces of the Service Metadata Locator (SML) service and the Service Metadata Publisher
- 65 (SMP) service cover both sender-side lookup and metadata management performed by SMPs.
- 66 Business Document Exchange Network (BUSDOX) mandates the following interfaces for these
- 67 services:

63

68

69

70

71

72

74

84 85

86

87

88

89

- Service Metadata Locator:
 - DNS-based resolve mechanism to locate individual SMPs
 - Management interface towards SMPs
- Service Metadata Publishers:
 - Discovery interface towards senders
- 73 This specification only covers the discovery interface for Service Metadata Publication services.

2.1 Discovery flow

- 75 For a sender, the first step in the Discovery process is to establish the location of the Service
- 76 Metadata relating to the particular Participant Identifier to which the sender wants to transmit a
- 77 message. Each participant identifier is registered with one and only one Service Metadata Publisher.
- 78 The sender looks up the endpoint for the Service Metadata Publisher using the DNS-based Service
- 79 Metadata Locator service (this is a regular DNS resolve). The sender can then retrieve the metadata
- 80 associated with the Participant Identifier. This metadata includes the information necessary to
- 81 transmit the message to the recipient endpoint.
- The diagram below represents the lookup flow for a sender contacting both the Service Metadata
- 83 Locator and the SMP.

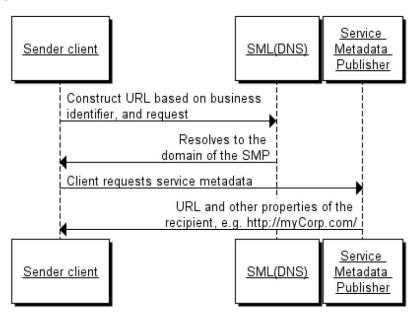

Fig. 2: Endpoint lookup with Service Metadata

Note: For optimization reasons, the discovery doesn't have to be performed for every transfer if the necessary information for transfer is already cached from previous transmissions. Though necessary exception handling has to be in place i.e. new lookup has to be performed if the sending shows that information is outdated e.g. old endpoint address.

2.1.1 Discovering services associated with a Participant Identifier

- 91 In addition to the direct lookup of Service Metadata based on participant identifier and document
- type, a sender may want to discover what document types can be handled by a specific participant
- 93 identifier. Such discovery is relevant for applications supporting several equivalent business
- 94 processes. Knowing the capabilities of the recipient is valuable information to a sender application
- and ultimately to an end user. E.g. the end user may be presented with a choice between a "simple"
- 96 and a "rich" business process.
- 97 This is enabled by a pattern where the sender first retrieves the ServiceGroup entity, which holds a
- 98 list of references to the ServiceMetadata resources associated with it. The SignedServiceMetadata in
- 99 turn holds the metadata information that describes the capabilities associated with the recipient
- 100 participant identifier

90

105

106

107108

109110

111112

113

114

2.2 Service Metadata Publisher Redirection

For each participant identifier, the SML may only point to a single SMP. There are cases however where the owner of a participant identifier may want to use different SMPs for different document types or processes. This is supported by Service Metadata Publisher Redirection.

In this pattern, the sender is redirected by the SMP to a secondary, remote SMP where the actual *SignedServiceMetadata* can be found. A special element within the *SignedServiceMetadata* record of the SMP points to the SMP that has the actual Service Metadata and certificate information for that SMP. The diagram below shows this flow:

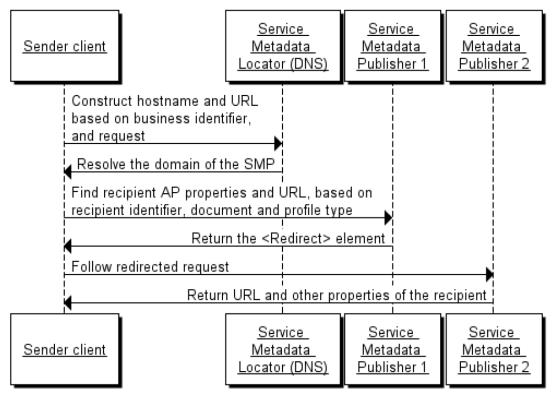

Fig. 3: Service Metadata Redirection

Note that only one degree of redirect is allowed; clients are not required to follow more than one redirect, i.e. a redirect resource cannot point to another redirect resource. Allowing one level of redirect permits the described use case to be realized, while avoiding the possibility of cyclic references and long chains of redirects

3 Interface model

- 116 This specification defines a REST-based interface for retrieving Service Metadata, but does not
- specify interfaces for creating, updating, deleting and managing Service Metadata, or any internal
- 118 data storage formats.
- 119 The goal is to allow the interface in this specification to expose data from many different Service
- Metadata back-ends, which may be based on any suitable technology such as for example RDBMS,
- 121 LDAP, or UDDI.

- Note that when adding or deleting Participant Identifiers in the SMP, an implementation of the SMP
- will need to reflect its custody of a Participant Identifier in the SML. Please see the SML specification
- 124 [BDEN-SML] for a description of the processes and interfaces for doing this.

4 Data model

- This section outlines the data model of the interface. The data model comprises the following main data types:
- ServiceGroup

125

129

- ServiceMetadata / SignedServiceMetadata
- 130 Supporting data types for these main types are:
- ServiceInformation
- ServiceEndpointList
- ParticipantIdentifier
- DocumentIdentifier
- 135 Redirect
- Process
- ProcessList
- Endpoint
- Each of these data types is described in detail in the following sections.

4.1 On extension points

- 141 For each major entity, extension points have been added with the optional <smp:Extension>
- 142 element.

140

146

147148

149

150

151

152

143 4.1.1 Semantics and use

- 144 Child elements of the <smp:Extension> element are known as "custom extension elements".
- 145 Extension points may be used for optional extensions of service metadata. This implies:
 - Extension elements added to a specific Service Metadata resource MUST be ignorable by any
 client of the transport infrastructure. The ability to parse and adjust client behaviour based
 on an extension element MUST NOT be a prerequisite for a client to locate a service, or to
 make a successful request at the referenced service.
 - A client MAY ignore any extension element added to specific service metadata resource instances.

4.2 ServiceGroup

- 153 The ServiceGroup structure represents a set of services associated with a specific participant
- identifier that is handled by a specific SMP. The ServiceGroup structure holds a list of references to
- 155 SignedServiceMetadata resources in the ServiceList structure.
- 156 Pseudo-schema for *ServiceGroup*:

```
157
      <smp:ServiceGroup>
158
        <ids:ParticipantIdentifier scheme="xs:string">
159
          xs:string
160
        </ids:ParticipantIdentifier>
        <smp:ServiceMetadataReferenceCollection>
161
162
          <smp:ServiceMetadataReference href="xs:anyURI" />*
163
        </smp:ServiceMetadataReferenceCollection>
164
        <smp:Extension>xs:any</smp:Extension>?
      </smp:ServiceGroup>
165
```

166 Description of the individual fields (elements and attributes).

Field	Description
ServiceGroup	Document element
ParticipantIdentifier	Represents the business level endpoint key and key type, e.g. a DUNS or GLN number that is associated with a group of services. See [PFUOI4] for information on this data type.
ServiceMetadataReferenceCollection	This structure holds a list of references to SignedServiceMetadata structures. From this list, a sender can follow the references to get each SignedServiceMetadata structure.
ServiceMetadataReference (0*)	Contains the URL to a specific SignedServiceMetadata instance - see the REST binding section for details on the URL format. Note that references MUST refer to SignedServiceMetadata records that are signed by the certificate of the SMP. It MUST NOT point to SignedServiceMetadata resources published by external SMPs.
Extension	The extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extended metadata to individual references to Service Metadata resources.

4.2.1 Non-normative example

167

168

190

Non-normative example of a *ServiceGroup* resource:

```
<?xml version="1.0" encoding="utf-8" ?>
169
170
171
      This sample assumes that the service metadata publisher resides at
      "http://serviceMetadata.eu/".
172
173
      It assumes that the business identifier is "0010:5798000000001".
174
      -->
175
      <ServiceGroup xmlns="http://busdox.org/serviceMetadata/publishing/1.0/"</pre>
176
      xmlns:ids="http://busdox.org/transport/identifiers/1.0/">
177
        <ids:ParticipantIdentifier scheme="busdox-actorid-upis">
178
          0010:5798000000001
179
        </ids:ParticipantIdentifier>
180
        <ServiceMetadataReferenceCollection>
181
          <ServiceMetadataReference href="http://serviceMetadata.eu/busdox-actorid-</pre>
      upis%3A%3A0010%3A5798000000001/services/busdox-docid-
182
183
      qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice-
184
      2%3A%3AInvoice%23%23UBL-2.0"/>
185
        </ServiceMetadataReferenceCollection>
186
        <Extension>
          <ex:Test xmlns:ex="http://test.eu">Test</ex:Test>
187
188
        </Extension>
189
      </ServiceGroup>
```

4.3 ServiceMetadata

- 191 This data structure represents Metadata about a specific electronic service. The role of the
- 192 ServiceMetadata structure is to associate a participant identifier with the ability to receive a specific

- document type over a specific transport. It also describes which business processes a document can
- 194 participate in, and various operational data such as service activation and expiration times.
- 195 The ServiceMetadata resource contains all the metadata about a service that a sender Access Point
- 196 needs to know in order to send a message to that service.

4.3.1 Redirection

197

211

- 198 For recipients that want to associate more than one SMP with their participant identifier, they may
- 199 redirect senders to an alternative SMP for specific document types. To achieve this, the
- 200 ServiceMetadata element defines the optional element Redirect. This element holds the URL of
- the alternative SMP, as well as the Subject Unique Identifier of the destination SMPs certificate used
- 202 to sign its resources.
- 203 In the case where a client encounters such a redirection element, the client MUST follow the first
- 204 redirect reference to the alternative SMP. If the SignedServiceMetadata resource at the alternative
- 205 SMP also contains a redirection element, the client SHOULD NOT follow that redirect. It is the
- responsibility of the client to enforce this constraint.
- 207 Pseudo-schema for this data type:

Pseudo-schema for the ServiceInformation data type:

```
212
      <smp:ServiceInformation>
213
        <ids:ParticipantIdentifier scheme="xs:string">xs:string
214
        </ids:ParticipantIdentifier>
215
        <ids:DocumentIdentifier scheme="xs:string" />
216
        <smp:ProcessList>
217
          <smp:Process>+
218
            <ids:ProcessIdentifier scheme="xs:string" />
219
            <smp:ServiceEndpointList>
220
              <smp:Endpoint transportProfile="xs:string">+
                <wsa:EndpointReference />
221
222
                <smp:RequireBusinessLevelSignature>xs:boolean
223
                </smp:RequireBusinessLevelSignature>
224
                <smp:MinimumAuthenticationLevel>xs:string
225
                </smp:MinimumAuthenticationLevel >?
226
                <smp:ServiceActivationDate>xs:dateTime
227
                </smp:ServiceActivationDate>?
228
                <smp:ServiceExpirationDate>xs:dateTime
229
                </smp:ServiceExpirationDate>?
230
                <smp:Certificate>xs:string</smp:Certificate>
231
                <smp:ServiceDescription>xs:string
232
                </smp:ServiceDescription>
233
                <smp:TechnicalContactUrl>xs:anyURI
234
                </smp:TechnicalContactUrl>
235
                <smp:TechnicalInformationUrl>xs:anyURI
236
                </smp:TechnicalInformationUrl>?
237
                <smp:Extension>xs:any</smp:Extension>?
238
              </smp:Endpoint>
239
            </smp:ServiceEndpointList>
240
            <smp:Extension>xs:any</smp:Extension>?
241
          </smp:Process>
242
        </smp:ProcessList>
243
        <smp:Extension>xs:any</smp:Extension>?
244
      </smp:ServiceInformation>
```

245 Pseudo-schema for the Redirect data type:

- The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the service metadata.
- The href attribute of the Redirect element contains the full address of the destination SMP record that the client is redirected to.
- 254 For example, assume that an SMP called "SMP1" has the address http://smp1.eu, and another
- 255 SMP called "SMP2" has the address http://smp2.eu, and a client requests a resource with the
- 256 following URL (note that these examples have been percent encoded):

```
http://smp1.eu/busdox-actorid-
upis%3A%3A0010%3A579800000001/services/busdox-docid-
qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice
- 2%3A%3AInvoice%23%23UBL-2.0
```

- We now assume that the owner of these metadata has moved them to SMP2. SMP1 would then return a *SignedServiceMetadata* resource with a Redirect child element that has the href attribute set to
- http://smp2.eu/busdox-actoridupis%3A%3A0010%3A579800000001/services/busdox-docidqns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice 267 - 2%3A%3AInvoice%23%23UBL-2.0
- For the list of endpoints under each Endpoint element in the ServiceEndpointList, each endpoint MUST have different values of the transportProfile attribute, i.e. represent bindings to different transports.
- Description of the individual fields (elements and attributes).

Field	Description
/ServiceMetadata	Document element
ServiceMetadata/Redirect	The direct child element of ServiceMetadata is either the Redirect element or the ServiceInformation element. The Redirect element indicates that a client must follow the URL of the href attribute of this element.
Redirect/CertificateUID	Holds the Subject Unique Identifier of the certificate of the destination SMP. A client SHOULD validate that the Subject Unique Identifier of the certificate used to sign the resource at the destination SMP matches the Subject Unique Identifier published in the redirecting SMP.
Redirect/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the Redirect.
ServiceMetadata/ServiceInformation	The direct child element of ServiceMetadata is either the Redirect element or the

Field	Description
	ServiceInformation element. The ServiceInformation element contains service information for an actual service registration, rather than a redirect to another SMP.
ServiceInformation/ParticipantIdentifier	The participant identifier. Comprises the identifier, and an identifier scheme. This identifier MUST have the same value of the {id} part of the URI of the enclosing ServiceMetadata resource. See the ParticipantIdentifier section of the 'Policy for use of identifiers' document [PFUOI4] for information on this data type.
ServiceInformation/DocumentIdentifier	Represents the type of document that the recipient is able to handle. The document type is represented by an identifier (identifying the document type) and an identifier scheme, which the format of the identifier itself. See the DocumentTypeIdentifier section of the 'Policy for use of identifiers' document [PFUOI4] for information on this data type.
ServiceInformation/ProcessList	Represents the processes that a specific document type can participate in, and endpoint address and binding information. Each process element describes a specific business process that accepts this type of document as input and holds a list of endpoint addresses (in the case that the service supports multiple transports) of services that implement the business process, plus information about the transport used for each endpoint. See the Process section of the 'Policy for use of identifiers' document [PFUOI4] for information on the identifier format.
Process/ProcessIdentifier	The identifier of the process. See the 'Policy for use of identifiers' document for a definition of process identifiers [PFUOI4]
Process/ServiceEndpointList	List of one or more endpoints that support this process.
ServiceEndpointList/Endpoint	Endpoint represents the technical endpoint and address type of the recipient, as an URL.
Endpoint/EndpointReference	The address of an endpoint, as a WS-Addressing Endpoint Reference (EPR).
Endpoint/@transportProfile	Indicates the type of transport protocol that is being used between access points, e.g. the Peppol AS4 profile (peppol-transport-as4-v2_0). A list of valid transport protocols is referenced from the 'Policy for use of identifiers' document [PFUOI4].

Field	Description
Endpoint/RequireBusinessLevelSignature	Set to true if the recipient requires business-level signatures for the message, meaning a signature applied to the business message before the message is put on the transport. This is independent of the transport-level signatures that a specific transport profile, such as the Peppol AS4 profile, might mandate. This flag does not indicate which type of business-level signature might be required. Setting or consuming business-level signatures would typically be the responsibility of the final senders and receivers of messages, rather than a set of APs.
Endpoint/MinimumAuthenticationLevel	Indicates the minimum authentication level that recipient requires. The specific semantics of this field is defined in a specific instance of the BUSDOX infrastructure.
	It could for example reflect the value of the "urn:eu:busdox:attribute:assurance-level" SAML attribute defined in the START specification.
Endpoint/ServiceActivationDate	Activation date of the service. Senders SHOULD ignore services that are not yet activated.
	Format of ServiceActivationDate date is xs:dateTime.
Endpoint/ServiceExpirationDate	Expiration date of the service. Senders SHOULD ignore services that are expired.
	Format of ServiceExpirationDate date is xs:dateTime.
Endpoint/Certificate	Holds the complete signing certificate of the recipient AP, as a PEM (base 64) encoded X509 DER formatted value.
Endpoint/ServiceDescription	A human readable description of the service.
Endpoint/TechnicalContactUrl	Represents a link to human readable contact information. This might also be an email address.
Endpoint/TechnicalInformationUrl	A URL to human readable documentation of the service format. This could for example be a web site containing links to XML Schemas, WSDLs, Schematrons and other relevant resources.
Process/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the process metadata block as a whole.
ServiceInformation/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the service metadata.

4.3.2 Non-normative example

272

273

274

For a non-normative example of a *ServiceMetadata* resource, see the *SignedServiceMetadata* non-normative example below.

4.4 SignedServiceMetadata

- 276 The SignedServiceMetadata structure is a ServiceMetadata structure that has been signed by the
- 277 SMP, according to governance policies that are not covered by this document. Pseudo-schema for
- 278 this data type:

275

283

284 285

286

- ServiceMetadata is the ServiceMetadata element covered by the signature.
- Signature represents an enveloped XML signature over the SignedServiceMetadata element.

4.4.1 Non-normative example

Non-normative example of a *SignedServiceMetadata* resource.

5 Service Metadata Publishing REST binding

This section describes the REST binding of the SMP interface.

5.1 The use of HTTP

383 384

385

397

401

- A service implementing the REST binding MUST set the HTTP Content-Type header, and give it a value of text/xml or application/xml. A service implementing the REST profile MUST NOT
- 388 use TLS (Transport Layer Security) or SSL (Secure Sockets Layer). An instance of the BUSDOX
- 389 infrastructure MAY set restrictions on what ports are allowed.
- An implementation of the SMP might choose to manage resources through the HTTP POST, PUT and DELETE verbs. It is however up to each implementation to choose how to manage records, and use of
- 392 HTTP POST, PUT and DELETE is not mandated or regulated by this specification.
- 393 HTTP GET operations MUST return the following HTTP status codes:

HTTP Status Code	Meaning
200	Must be returned if the resource is retrieved correctly.
404	Code 404 must be returned if a specific resource could not be found. This could for example be the result of a request containing a participant identifier that does not exist.
500	Code 500 must be returned if the service experiences an internal processing error.

- 394 The service MAY support other HTTP status codes as well.
- The service SHOULD NOT use HTTP redirection in the manner indicated by the HTTP 3xx codes.
- 396 Clients are not required to support active redirection.

5.2 The use of XML and encoding

- 398 XML document returned by HTTP GET MUST be UTF-8 encoded. They MUST contain a document type
- declaration starting with <?xml which includes the encoding attribute set to UTF-8. Please
- 400 observe that the content of the encoding attribute is not case sensitive. Version 1.0 of XML is used.

5.3 Resources and identifiers

The REST interface comprises 2 types of resources.

Resource	URI	Meth od	XML resource root element	HTT P Stat us	Description of returned content
ServiceGroup	/{identifier scheme}::{id}	GET	<servicegr oup></servicegr 	200; 500; 404	Holds the participant identifier of the recipient, and a list of references to individual ServiceMetadata resources that are associated with that participant identifier.
SignedServiceMet	/{identifier	GET	<signedse< td=""><td>200;</td><td>Holds all of the metadata</td></signedse<>	200;	Holds all of the metadata

adata	scheme}::{id}/ser vices/{docType}	rviceMeta data>	500; 404	about a Service, or a redirection URL to another Service Metadata Publisher
	See section below for {docType} format			holding this information.

Fig. 4: Table of resources and identifiers

A service implementing the REST binding MUST support these resource types. It MUST provide access to these using the URI scheme of table in Fig. 3.

406 5.3.1 On the use of percent encoding

403

404

405

- When any types of BUSDOX identifiers are used in URLs, each section between slashes MUST be
- 408 percent encoded according to [RFC3986] individually, i.e. section by section.
- 409 For example, this implies that for an URL in the form of / {identifier
- scheme)::{id}/services/{docType} the slash literals MUST NOT be URL encoded.

411 5.3.2 Using identifiers in the REST Resource URLs

- 412 This section describes specifically how participant and document identifiers are used to reference
- 413 ServiceGroup and SignedServiceMetadata REST resources. For a general definition on how to
- represent participant and document identifiers in URLs, see [PFUOI4].
- For the URL referencing a ServiceGroup resource, the {identifier scheme}::{id} part
- 416 follows the participant identifier format described in the "ParticipantIdentifier" section of the 'Policy
- 417 for use of identifiers' document [PFUOI4].
- 418 The following URL format is used:
- 419 /{identifier scheme}::{id}
- 420 In the reference to the SignedServiceMetadata or Redirect resources
- 421 (/{id}/services/{docType}), the {docType} part consists of {document type
- 422 identifier scheme \cdot: \(\) document type identifier \(\). For information on the format
- 423 of {document type identifier}, see the DocumentIdentifier section of the 'Policy for use of
- 424 identifiers' document [PFUOI4].

425 **5.3.3 Non-normative identifier example**

- We assume an SMP can be accessed at the URL http://serviceMetadata.eu.
- 427 A business with the participant identifier 0010:579800000001 would have the following
- 428 identifier for the *ServiceGroup* resource:
- 429 http://serviceMetadata.eu/busdox-actorid-upis::0010:579800000001
- 430 After percent encoding:
- 431 http://serviceMetadata.eu/busdox-actorid-upis%3a%3a0010%3a5798000000001
- 432 In the case of a NES-UBL order, a SignedServiceMetadata or Redirect resource can then be identified
- 433 by

- Identifier format type: busdox-docid-qns
- Root namespace:
- urn:oasis:names:specification:ubl:schema:xsd:Order-2
- Document element local name: Order

- Subtype identifier: UBL-2.0 (since several versions of the Order schema may use the same namespace + document element name)
- The document type identifier will then be:
- busdox-docid-qns::urn:oasis:names:specification:ubl:schema:xsd:Order-2::Order##UBL-2.0
- The document type identifier MUST be percent encoded as described in [RFC3986]. The above, non-
- 444 normative example is thus encoded to
- 445 busdox-docid-
- 446 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AOrder-
- 447 2%3A%3AOrder%23%23UBL-2.0
- The entire URL reference to a SignedServiceMetadata or Redirect resource thus has the form
- 449 {URL to server}/{identifier scheme}::{id}/services/{document identifier 450 type}::{rootNamespace}::{documentElementLocalName}[##{Subtype identifier}]
- 451 The percent-encoded form of the identifier using the above example will then be
- 452 http://serviceMetadata.eu/busdox-actorid-
- 453 upis%3a%3a0010%3a579800000001/services/busdox-docid-
- 454 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AOrder-
- 455 2%3A%3AOrder%23%23UBL-2.0
- 456 Note that the forward slashes delimiting the individual parts of the REST resource identifier URL are
- 457 not percent encoded, since they are part of the URL.
- 458 **5.3.4** Implementation considerations
- When a client is redirected to an SMP using the DNS-based SML scheme described in [BDEN-SML],
- 460 the HTTP Host header will be set to a value originating from the CNAME alias set in the SML
- 461 (http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.23). Implementations should be
- prepared to accept requests with this "host" header value.
- 463 5.4 Referencing the SMP REST binding
- 464 For referencing the SMP REST binding, for example from SML records, the following identifier should
- be used for the version 1.0 of the SMP REST binding:
- 466 http://busdox.org/serviceMetadata/publishing/1.0/
- This is identical to the target namespace of the SMP schema.
- 468 **5.5 Security**
- 469 At the transport level, the service MUST NOT be secured.
- 470 **5.5.1 Message signature**
- The message returned by the service is signed by the Service Metadata Publisher with XML-Signature
- according to the standard http://www.w3.org/TR/2002/REC-xmldsiq-core-
- **473** 20020212/.
- The signature MUST be an enveloped XML signature represented via a ds:Signature element
- 475 embedded in the SignedServiceMetadata element. The ds:Signature element MUST be
- 476 constructed according to the following rules:
- The <Reference> MUST use exactly one Transform being:
- http://www.w3.org/2000/09/xmldsig#envelopedsignature

- The <ds:KeyInfo> element MUST contain an <ds:X509Data> element with an
 <ds:X509Certificate> sub-element containing the signer's X.509 certificate as PEM (base 64)
 encoded X509 DER value.
- The canonicalization algorithm MUST be
 http://www.w3.org/2001/10/xml-exc-c14n#
- The SignatureMethod MUSTbe http://www.w3.org/2000/09/xmldsig#rsa-sha1
- The DigestMethod MUST behttp://www.w3.org/2000/09/xmldsig#sha1

488 5.5.2 Verifying the signature

493

494

495

496

- When verifying the signature, the consumer has access to the full certificate as a PEM (base 64)
 encoded X509 DER value within the dsSignature element. The consumer may verify the signature
 by
- a) extracting the certificate from the ds:X509Data element,
 - b) verify that it has been issued by the trusted root,
 - c) perform a validation of the signature, and
 - d) perform the required certificate validation steps (which might include checking expiration/activation dates and revocation lists).

497 5.5.3 Verifying the signature of the destination SMP

For the redirect scheme, the unique identifier of the destination SMP signing certificate is stored at the redirecting SMP. In addition to the regular signature validation performed by the client of the destination SMP resources, the client SHOULD also validate that the identifier of the destination SMP signing certificate corresponds to the unique identifier which the redirecting SMP claims belongs to the destination SMP.

503

504

6 Appendix A: Schema for the REST interface

This section defines the XML Schema for all the resources of the REST interface.

```
<?xml version="1.0" encoding="utf-8"?>
